

## Lot 6 House

Anomaly **N100.6 E237.2** was a circular-shaped stain measuring 60 cm in diameter and being dark olive brown (2.5Y 3/3) in color. The stain was first identified at the Apz/ B1 interface at 40 cmbgs and continued to 60 cmbgs. In profile it appeared as a small pit with vertical to inwardly sloping sides. Cultural material recovered consisted of charcoal, quartz debitage, Native pottery, and calcined bone throughout the entire depth of the anomaly. This likely indicates that it was filled in one episode. This anomaly was interpreted as a medium-sized medium-depth pit.

## Lot 6 House

Anomaly **N100.6 E244** was a large, 125 by 105 cm, oval-shaped stain that was olive brown (2.5Y 4/3) in color at its surface, which was encountered at the Apz/ B1 interface, 40 cmbgs. This stain continued to a depth of 85 cmbgs. This stain appears to be a large size, deep depth pit interpreted as a storage pit. The fill within the pit was a very homogeneous olive brown (2.5Y 4/3) with some mottling on the edges. One large rock was encountered in the center of the pit and several smaller roots and patches of subsoil were identified. The pit walls were gradually sloping inward while the floor was flat and measured 85 cm in diameter. Cultural material recovered consisted of quartz debitage, charcoal, Native pottery, and unburned deer bone and teeth.

## Lot 6 House

Anomaly **N101.5 E233.4** was bisected by the southern edge of the house envelope. It appeared as a large, 105 by 135 cm, concentration of brown soil (2.5Y 4/3) with fire-cracked rock in the center and a slightly amorphous shape. Excavation revealed a shallow irregularly shaped stain that was only three centimeters deep, extending from 40 to 43 cmbs. Cultural material recovered from within the anomaly consisted of Native pottery, fire-cracked rock, charcoal, and quartz and rhyolite debitage. The stain appeared to be a natural depression into which Native refuse may have been deposited.

## Lot 6 House

Anomaly **N102.5 E235** was a large, 130 by 120 cm, roughly round-shaped stain dark grayish brown (2.5Y 4.2) at 40 cmbgs. The stain extended to 55 cmbgs and appeared to be a shallow basin with gradually sloping sides. Cultural material consisted of chert and quartz debitage, charcoal, and Native pottery. From 45 cm on, the stain shape was more amorphous.

## Lot 6 House

Anomaly **N102.7 E229.6** was a circular-shaped stain with diffuse edges. It measured 34 by 37 cm and was first encountered at 40 cmbs. The stain was brown (10YR 4/3) in color and only extended five centimeters into the subsoil. This stain contained no cultural material and is considered to be natural.

Lot 6 House  
N102.7 E229.6

## Lot 6 House

Anomaly **N103.6 E238.75** was a round-shaped stain dark olive brown (2.5Y 3/3) in color, measuring 78 cm in diameter. This stain extended from 40 to 80 cmbgs and appeared in profile as a steeply sloped-sided medium-sized medium depth pit. With four separate fill deposits within it. The lowest deposit, Fill Deposit 1, was concentrated in the east and west sides of the anomaly and did not extend into the center of the pit. This deposit was light olive brown (2.5Y 5/6) in color and did not contain any cultural material. Fill Deposit 2 extended from approximately 65 to 80 cmbgs and sloped in from 50 cmbgs on the eastern edge. Fill Deposit 2 was olive brown (2.5Y 4/4) in color and contained only small amounts of charcoal. Fill Deposit 3 was dark olive brown (2.5 Y 3/3) in color and extended from 40 to 65 cmbgs. Cultural material recovered from this deposit included unburned and burned bone, charcoal, Native pottery, quartz debitage, carbonized maize, deer and bear bone, and calcined bone. Fill Deposit 1 was concentrated in the eastern two-thirds of the anomaly and extended from 40 to 50 cmbgs. Cultural material recovered from this layer was the same as Fill Deposit 2. It appears that this anomaly contained at least two temporally separate fill deposits- a lower clean fill, possibly washed in after the pit was initially abandoned, and an upper faunal rich deposit possibly deposited in the fall. The western edge of the anomaly was poorly defined and more amorphous than the eastern edge, possibly indicative of wall slump or erosion that occurred prior to the deposition of Fill Deposits 3 and 4.

## Lot 6 House

Anomaly **N103.7 E225.1** was a semi-oval shaped stain that was bisected by the south wall of the house envelope. It measured 32 cm and extended 36 cm out of the house wall. At the surface, 35 cmbgs, the soils were mottled very dark grayish brown and pale yellow (10YR3/2 and 2.5Y7/4). This anomaly extended to 65 cmbgs and appeared in profile as a medium-sized medium depth pit. Three separate deposits were present in the profile a very dark grayish brown (10YR 3.2) deposits sloping into the pit from the west edge to the bottom, a central mottled deposit and a small eastern very dark grayish brown (10YR 3.2) deposit. Cultural material consisted on charcoal, debitage, FCR, and a projectile point tip. The stain is interpreted as a medium sized medium depth pit.

## Lot 6 House

Anomaly **N103.7 E237** was a round-shaped stain measuring 65 cm in diameter and, at 40 cmbgs where it first appeared at the Apz/ B1 interface, was brown (10YR4/3) in color. The stain was 15 cm deep and in profile it appeared as a shallow basin with steeply sloping sides. This stain was adjacent to anomaly **N104.3 E236.9**. Cultural material recovered included charcoal, quartz debitage, unburned bone, deer teeth and Native pottery, most of which was concentrated in the first five centimeters.

Anomaly **N104.3 E236.9** was round to oval-shaped, measuring 60 by 56 cm, and being brown(10YR4/3) in color at 40 cmbgs. This stain was adjacent to anomaly **N103.7 E237** and extended only five centimeters into the subsoil. Cultural material consisted of Native pottery, quartz debitage, charcoal and fish scales, all within the top five centimeters. In profile this anomaly appeared as a shallow basin, probably cultural which was possibly used or reused as a place to deposit refuse.

## Lot 6 House

Anomaly **N103.8 E244** was a large, 130 by 110 cm, circular-shaped stain where a black bear mandible was recovered from during the initial test pit testing of the house impact area. It was first visible at the Apz / B1 interface at 40 cmbgs, where it was olive brown (2.5Y 4/4) in color. This pit extended from 40 to 120 cmbgs and in profile it had steeply sloping sides and a flat floor. The pit fill consisted of four fill deposits. Fill Deposit 1, which extended from 90 to 120 cmbgs (the floor) was light yellowish brown (2.5Y6/3) in color and had a few scattered natural cobbles in it. Cultural material recovered was limited to charcoal, quartz debitage, calcined bone and Native pottery. Fill Deposit 2 extended from 60 cmbgs to 90 cmbgs and angled higher in the west, tapering off and going deeper before reaching the eastern wall. A few scattered cobbles were recovered from the light yellowish brown (2.5Y6/4) soil fill, along with charcoal, quartz debitage, a quartz small stemmed point and quartz core, calcined and unburned bone. Fill Deposit 3 was concentrated against the eastern wall between 60 and 100 cmbgs and extended from the east wall 40 cm to the west, tapering off and resting on top of the eastern portion of Fill 2. This deposit had a higher concentration of cobbles and was olive brown (2.5Y4/4) in color. Cultural material recovered from this deposit included charcoal, quartz debitage and unburned bone. Fill Deposit 4 capped Fill Deposits 2 and 3 and extended from 40 to 60 cmbgs. This deposit was light olive brown (2.5Y4/4) in color and contained charcoal, calcined and unburned bone, small pieces of quartz and jasper debitage, carbonized maize and fire-cracked rock, and Native pottery. One deposit of mottled soil, possibly representing a separate fill deposit of a disturbed portion of Fill deposit 4, was encountered extending from the eastern wall 40 cm to the west. This soil deposit, designated Fill Deposit 5, was light olive brown and light yellowish brown (2.5Y5/4 and 2.5Y6/4 in color). Cultural material recovered was similar to that recovered from Fill Deposit 4. This deposit extended beyond the eastern edge of the pit proper and may represent an area of slumped or eroded or otherwise impacted pit edge. Fill Deposit 6 was located on top of the center of the pit, capping portions of Fill Deposits 4 and 5. Fill Deposit 6 was olive brown (2.5Y4/4) and probably represents topsoil in the pit slump. This anomaly was interpreted as representing a large, deep pit, likely a storage pit that later was used as a convenient place to deposit refuse, possibly at two separate times.

### Lot 6 House

Anomaly **N104 E241.6** was a large circular stain measuring 95 by 92 cm and being light olive brown (2.5Y5/4) in color. This stain was located 2.5 m to the west of a similar stain and 3 m to the east of a similar one. Excavation revealed a straight sided, round-bottomed large deep pit with two fill deposits present. Fill Deposit 1 was the deepest of the two. This deposit extended from the surface of the anomaly at 40, to the bottom at 80 cmbgs, forming a crescent shaped deposit that emerged on the edges of the stain. Fill Deposit 2, a olive brown (2.5Y4/4) colored deposit, was situated within the crescent and extended from the surface to 55 cmbgs at its center. Fill Deposit 1 contained charcoal, quartz debitage, calcined bone, and Native pottery with concentration petering out as excavation proceeded deeper. The last 10 cm of the anomaly yielded little cultural material. Fill Deposit 2 yielded charcoal, quartz, jasper, chert, and rhyolite debitage, Native pottery, and calcined bone. The pit is believed to have originally served as a storage pit. Apparently Fill Deposit 1 was deposited first and enough time may have passed, possibly a season, for the center to settle while the edges remained at the anomaly rim edges. Subsequently, Fill Deposit 2 was deposited, leveling and filling the settled depression in the center of the anomaly. The composition of the deposits was similar enough to suggest that similar activities resulted in the refuse that was deposited in this pit.

## Lot 6 House

Anomaly **N104.5 E243** was a tri-lobed stain which was somewhat amorphous in shape and contained multiple colored patches, light olive brown, light olive brown, and olive brown (2.5Y5/4, 2.5Y5/3, and 2.5Y4/3) at the surface at 40 cmbgs. The anomaly measured 160 by 180 cm and it eventually resolved itself into a large pit with sharply sloping sides and a flat bottom with either an earlier pit to the west that was inter-cut by the larger pit or, a larger pit that had been post-use impacted by tree, erosion or rodent disturbance to the west. The larger pit had multiple fill deposits and mottled patches present. Fill Deposit 11 was olive brown (2.5 Y 4/3) in color and extended from 40 to 55 cmbgs, being concentrated in the eastern portion of the stain, in the center of the large pit. Cultural material consisted of Native pottery, charcoal, quartz debitage, charcoal, carbonized maize, and calcined bone. Fill Deposit 8 began at the surface of the anomaly at 40 cmbgs and extended from the western to the center of the pit to a total depth of 110 cmbgs, extending below Fill Deposit 11. This deposit was light light olive brown (2.5Y5/3) in color and did not contain any cultural material. Fill Deposit 3 may have originated from the western side of the pit, possibly after the open pit edges had begun to erode, with this deposit representing the initial erosion of the pit edges. Fill Deposits 4-7 and 9-10 formed a mottled deposit olive brown, light olive brown, light yellowish brown, olive brown, strong brown, and light olive brown (2.5Y4/3, 2.5Y5/6, 2.5Y6/4, 2.5Y6/6, 7.5YR5/6, and 2.5Y5/6) in color extending from 65 to 100 cmbgs in the eastern half of the pit. It was deposited on top of Fill Deposit 3, possibly from the east. This deposit contained little cultural material with what was recovered being limited to charcoal, a small amount of calcined bone and quartz debitage. Fill Deposit 3 was a light olive brown (2.5Y5/4) deposit extending from 40 cmbgs to 80 cmbgs across the entire large pit in a crescent shaped deposit resting on top of Fill Deposits 1 and 2. Cultural material that was recovered included carbonized maize, quartz debitage, charcoal, fire-cracked rock, and unburned fish vertebrae. Fill Deposit 2 was a light olive brown (2.5Y5/6) was located below Fill Deposit 3. Fill Deposit 1 was the deepest deposit, located in the western edge of the anomaly. It was light olive brown (2.5Y5/4) in color. The soils to the west of the large pit consisted of several patches of disturbed subsoil ranging in color from light olive brown (2.5Y5/4) to olive yellow (2.5Y6/8) (Fill Deposit 2a) to the B2 subsoil, light olive brown (2.5Y5/6). No cultural material was recovered from the eastern half and the disturbance may be the result of rodent or tree roots. This anomaly appears to have begun as a large deep pit, interpreted as a storage pit, which subsequently was abandoned, left open, which began eroding from the eastern side. It eroded to the degree that the upper third of the eastern wall had collapsed into the pit forming Fill Deposit 3 and possibly Fill Deposit 8. It was then subsequently used as a refuse pit for the deposition of the materials in Fill Deposits 4 to 7 and 9-11.

## Lot 6 House

Anomaly **N104.85 E235.5** was an oval-shaped concentration of fish scales, shell, and quartz debitage visible on the surface at 35 cmbgs. This concentration measured 73 x 82 cm and was light olive brown and dark olive brown (2.5Y5/4 and 2.5Y3/3) in color. The stain shrank dramatically at 40 cmbgs with most of the dark soil disappearing except in the southeast quarter. The stain was gone by 45 cmbgs with fish scales, charcoal, and quartz debitage continuing to occur to the bottom of the stain. This anomaly was interpreted as a shallow basin which served as a location to deposit refuse in.

## Lot 6 House

Anomaly **N105.2 E233.5** was a round-shaped stain with three projections coming off of it. It measured 70 by 60 cm at 40 cmbs and was brown (10YR4/3) in color. The stain shrank and became more amorphous in shape as excavation continued to the final depth of 55 cmbs. It was determined that this stain was a tree stump and associated roots. Cultural material was recovered from the top five centimeters, consisting of charcoal, quartz debitage, and a piece of redware.

Lot 6 House  
N105.2 E233.5

## Lot 6 House

Anomaly **N106 E243.3** was a roughly squared oval stain that was light olive brown (2.5Y5/4) in color at its surface, 30 cmbs. The stain measured 140 by 90 cm and disappeared after 10 cm of excavation. Cultural material recovered consisted on charred maize, charcoal, and quartz debitage. In profile it was a shallow stain with gradually sloping sides. This stain is interpreted as being a shallow basin, possibly natural, that collected or received a slight amount of cultural material.

## Lot 6 House

Anomaly **N108.8 E235.7** appeared as three possible interconnected stains at the Apz/ B1 interface at 40 cmbgs. Overall this anomaly measured 245 by 80 cm and was mottled light yellowish brown, light olive brown, and dark olive brown (2.5Y6/3, 2.5Y5/6, and 2.5Y3/3) in color. Excavation revealed a larger stain in the center (**N108.8 E235.7**) with a shallow basin-shaped stain to the north (**N108.8a E235.7a**) and a medium sized slightly deeper basin-shaped stain to the south (**N108.8b E235.7b**). The northern stain measured 45 by 35 cm and was five centimeters deep. The southern stain was 30 cm in diameter and 10 cm deep. The main larger stain was 60 by 60 cm and extended to 85 cmbgs. The larger central stain appears to have intersected the preexisting southern stain while the north stain remained separate. All three stains were very mottled throughout and had extensions which extended out beneath the B1 subsoil. These stains all appear to have been impacted by a rodent run. Cultural material recovered from the northern basin consisted on charcoal and quartz debitage. Cultural material from the southern basin consisted of charcoal, quartz debitage, Native pottery, and calcined bone. Cultural material from the central pit consisted of calcined bone, charcoal, Native pottery, and quartz debitage.

Lot 6 House  
N108.9 E225.55  
Plan at 30 cmbs  
9/1/2007

## Lot 6 House

Anomaly **N109.3 E230.4** was a circular-shaped stain with a heavy concentration of charcoal with a slight area of dark soil to the south of the main stain. This stain measured 40 by 36 cm and at 35 cmbs, at the Apz to b1 subsoil interface, it was a olive brown (2.5Y4/3) with little gravel present. This stain was only eight centimeters deep and appeared to be a shallow basin in profile. Cultural material found within the anomaly consisted of unburned fish and mammal bone, charcoal, calcined bone, quartz debitage, and surf clam shell fragments. It appears that this basin was used as a refuse disposal area. It is unknown if this was the primary purpose or if it was just a convenient basin that could be filled at the time. The cultural material all appeared to derived from hearth and cooking waste, possibly indicating either a cultural preference for the disposal of certain types of waste or that this anomaly was located close to where these foods present were processed.

Lot 6 House  
N109.3 E230.4

## Lot 6 House

Anomaly **N111.2 E228.2** was a tri-lobed stain that eventually revealed itself to be a shallower basin and a deeper medium sized pit, side by side and likely contemporaneous. The overall anomaly was 175 by 145 cm and was first visible at the Apz/ B1 interface at 40 cmbgs where it was dark brown (**10YR3/3**) in color. The southern lobe of the stain disappeared by 50 cmbgs and did not contain any artifacts, making it likely that this was not an intentionally excavated feature. By 50 cmbgs the north and middle stain were well-defined with the north stain gone by 60 cmbgs and the central stain gone by 70 cmbgs. The separation between the north and central stain appears to be the result of the encountering of a large rock encountered in the north stain and the possible shifting of the excavation further to the south into the central stain. The overall shape of the stain was a largesized medium depth pit with vertical northern wall and a sloping southern wall. Cultural material recovered consisted of thin shell-tempered Native pottery, charcoal, quartz debitage, and calcined bone, all of which was encountered throughout the anomaly. This likely indicates that it was filled at one time over a short duration of time.

## Lot 6 Septic

Anomalies **N113.75 E250.8** and **N113.15 E251.5** were two roughly oval to round stains located adjacent to and slightly connected to each other. Anomaly **N113.15 E251.5** was the larger of the two, measuring 120 by 90 cm, and was the southern and westernmost of the two. The western edge was bisected by the wall of the septic impact area. Anomaly **N113.75 E250.8** measured 80 by 75 cm and was of the same color, olive brown (2.5Y 4/3), at 30 cmbgs, where they first appeared, as the adjacent anomaly. Excavation revealed **N113.15 E251.5** to be a medium depth, medium-sized pit extending to 55 cmbgs, with a homogeneous fill with slightly sloping to almost vertical walls. Anomaly **N113.75 E250.8** was a medium-sized medium depth pit extending to 40 cmbgs, with a band of dark soil, very dark gray (2.5Y 3/1) in color, at 35 cmbgs, representing a separate fill deposit. The walls of this anomaly were more dramatically sloped than the previous one. Cultural material recovered from **N113.15 E251.5** consisted of fire-cracked rock, pottery, rhyolite and quartz debitage, and charcoal. Similar material was recovered from throughout the fill, indicating that it was filled in one episode over a short duration. Cultural material recovered from **N113.75 E250.8** consisted of fire-cracked rock, pottery, rhyolite and quartz debitage, carbonized maize, charcoal, unburned bone, surf clam shell fragments and fish scales.

## **Lot 6 Septic**

Anomaly **N114.3 E248.2** was a large tri-lobed stain measuring 175 by 97 cm first visible at 30 cmbgs. This anomaly was double bisected east to west and north to south. The northernmost of the stains, stain C, was shallow, disappearing by 45 cmbgs and contained no cultural material. Stain A, the easternmost stain, was a medium sized, medium depth pit that bottomed out at 50 cmbgs. It contained pottery, unburned bone, fish bones and scales, charcoal and shell. Stain B was another medium sized, medium depth pit that bottomed out at 55 cmbgs. Stain B contained one small quartz triangular point at 30 cmbgs but without any cultural material within it.

## Lot 6 Septic

Anomaly **N114.4 E253.3** was a large, 105 by 85 cm, scattered fire-cracked rock concentration associated with a Susquehanna Broad point and three point tips. This anomaly was first visible at 40 cmbgs, buried slightly below the Apz to B1 horizon interface. The concentration was only five centimeters deep and was excavated with a series of adjacent 1 x 1 meter squares, excavated by quadrant in five centimeter levels. The scattered FCR eventually resolved itself into an irregularly shaped concentration measuring 50 by 50 cm at 43 cmbgs. Along with the projectile points and FCR, small pieces of pottery were recovered.

## Lot 6 Septic

Anomaly **N116 E255.3** was bisected by the east wall of the septic impact area. It measured 60 cm long and extended 33 cm from the east wall. . It first became visible at 50 cmbgs where it appeared as a squared semi-circular stain with three patches of pale yellow, very dark gray, and olive brown (2.5Y 7/3, 2.5Y 3/1, and 2.5 Y4/3). One large piece of pottery was recovered at 50 cmbgs in the south half. No other cultural material was recovered and excavation revealed an amorphous shaped stain that had a curved root stain extending below 75 cmbgs at the bottom of the stain. This is interpreted as a medium sized medium depth pit.
