

Lot 7 Septic

The human burial from test pit N88 E250 in the Lot 7 Septic impact area was encountered at approximately 25-30 cmbs, when a concentration of bone identified at the junction of the plowzone and subsoil. The bone appears to lie within an olive brown (2.5Y4/3) stain that extends across the majority of the test pit floor. One small area of possible B1 subsoil was encountered in the northwest corner of the floor. The calcaneum was found near the center of the test pit while the tibia was encountered extending slightly into the east wall. Other bone fragments were identified in the floor of the test pit but were not further disturbed.

The north and south wall profiles of the test pit showed areas of slight mottling of the plowzone with possible patches of B1 subsoil, possibly representing backfilled soils. These areas of mottling were confined to the areas associated with the possible pit from in which the bone was located. No plowzone soils were observed within the possible pit within which the bones appeared to be concentrated, indicating that the possible pit was likely not dug through the plowzone.

The longbone fragment that was encountered in the northeast corner of the test pit was identified as a possible tibia midsection. It was observed to lie within the plowzone and the subsoil/ possible pit fill. Upon examination, the possible tibia was observed to have a break at one end that did not have a fresh appearance and must have occurred sometime prior to the bone being recently disturbed. This was the end of the bone that extended into the test pit wall. The other end of the bone had been impacted by the shovel excavation of the test pit, but was found to have at least one possible plow impact mark present. Several other marks were identified along one edge of the bone.

No bone or soil from this test pit were removed from the site and the test pit was lined with plastic, backfilled and covered to protect it.

Anomaly **N65.5 E257.4** was a large (75 cm x 40+ cm) round stain, first visible at 30 cmbs emerging from the south wall of the house impact area. The anomaly was very dark grayish brown (2.5Y4/2) in color and a large quartz cobble was present in the center of it. Upon excavation the stain was found to shift to the east and become slightly smaller to the south with abundant rocks and small roots. The stain disappeared by 40 cmbs, terminating in an uneven floor. It appears to either have been a shallow basin with cultural refuse, possibly cultural in origin. Recovered cultural material included a quartz biface and core, a chert flake, quartz shatter and several pieces of fire-cracked rock.

Lot 7 House
N65.5 E257.4

Lot 7 House

Anomaly **N68 E260** was a comma shaped stain measuring 40 cm north to south by 45 cm east to west. The anomaly was very dark grayish brown (2.5Y3/2) in color. It was first visible at 30 cmbs and was bisected east to west with the north half being excavated first. Within the first five centimeters of excavation the stain became more compact and oval shaped. The stain shrunk rapidly, losing much of its edge definition as it went deeper. The stain was gone by 50 cmbs and appears to represent a medium sized, medium depth pit. The edges of the pit flared out to the east and west in profile, possibly indicating that the pit was left open and eroded. Cultural material that was recovered included a quartz uniface, quartz shatter and two pieces of fire-cracked rock.

Anomaly **N68.9 E262.8** was a large sized, one meter north to south and 105 cm east to west, oval shaped olive brown (2.5Y4/3) and light olive brown (2.5Y5/4) stain. The anomaly was first encountered at 30 cmbs and was bisected north to south with the west half was excavated first. As excavation commenced, the stain shrunk to the center and extended to the west towards an adjacent rodent hole in the first five centimeters, and then expanded to the north and maintained somewhat wavy north and west edges in the next five centimeters. By 45 cmbs the stain edges had become more regular and stable, possibly reflecting weathering and edge collapse of an open pit in the upper reaches and more intact, unweathered lower ones. At 50 cmbs a darker halo of soil, Fill Deposit 2 dark yellowish brown (10YR5/6), encircled the edges while the center, Fill Deposit 1, was olive brown (2.5Y4/3) in color. It had also shrunk to 75 cm north to south by 80 cm east to west. The stain continued to shrink to the center and eventually bottomed out at 60 cmbs. The anomaly was interpreted as a large size medium depth possible storage pit. Recovered artifacts included historic artifacts in the top layer and fire-cracked rock, charcoal, rhyolite, hornfels and quartz debitage, shell and grit-tempered pottery and one quartz possible small triangular point.

Lot 7 House

Anomaly **N69.2 E261.5** was a figure-eight shaped stain oriented east to west with the eastern stain being slightly larger. The western half of the anomaly was dark grayish brown (2.5Y4/2) while the eastern half was very dark grayish brown (2.5Y3/2). Overall the anomaly measured 85 cm southeast to northwest and 65 and 53 cm northeast to southwest. This stain was first encountered at 30 cmbs at the plowzone, subsoil juncture. The anomaly was bisected at 316 degrees and the northeast halves were excavated separately first. By 35 cmbs the northeastern stain was more oval shaped with mottling now confined to the edges while in the southwest stain, a large stone began to appear on the north to south edge. The southeastern stain at 45 cm appeared to extend to the northeast under the B1 subsoil. The southwest stain was more mottled and getting much smaller. Both stains were gone by 50 cmbs with large stone present below the stains. Cultural material recovered consisted of charcoal, quartz shatter, fire-cracked rock and pieces of both shell and grit-tempered pottery. The anomaly is interpreted as rodent impacted double cache pits. This interpretation appears valid based on the size and shapes of these types of pits elsewhere within the project area and due to the presence of the rounded, bowl-like shaped bottoms to both stains in this anomaly.

Anomaly **N69 E259** was a round stain measuring 60 x 65 cm. It was located in a stone free portion of the house impact area with heavy rock concentrations to the south, east and west. This anomaly was dark grayish brown (2.5Y4/2) in color and was bisected east to west with the north half being excavated first. The stain was first visible at 30 cmbs and by 35 cm was much smaller, shrinking towards the center. The main portion of the stain was gone by 40 cmbs. Three possible postmolds were identified extending beneath the original stain. The anomaly was interpreted as a medium sized shallow basin. The artifacts recovered included abundant charcoal, fire-cracked rock, calcined bone, quartz shatter, one piece of graphite, and grit-tempered pottery. The presence of so much charcoal indicates either that this is a shallow fire basin with no oxidized soil or that this may have been a natural stain within which refuse was deposited.

Lot 7 House

Anomaly **N71 E261** was an round stain with an extension to the east on the eastern edge. It first became visible at 30 cmbs where it measured 71 cm x 80 cm and consisted of a mottled very dark gray brown and yellowish brown (2.5Y3/2 and 10YR5/6) halo around a very dark grayish brown (2.5Y3/2) center. The stain was bisected east to west with the north half being excavated first. As excavation proceeded, the stain separated into two separate stains, a larger western and a smaller eastern stain. The majority of the stain disappeared between 40 to 50 cmbs with the center and the eastern stain continuing past 60 cmbs, well into the B2 subsoil. Cultural material consisting of fire-cracked rock, charcoal, shell and grit-tempered pottery, quartz shatter and rhyolite flakes. All the cultural material was recovered from the upper levels of the anomaly. This anomaly is interpreted as being a natural tree stump stain that decomposed, resulting in a visible depression on the ancient ground surface, and was subsequently used as a refuse disposal area by Native people.

Anomaly **N56.6 E277** was a fire-cracked rock concentration measuring 69 by 50 cm. It was located on the edge of a Native house form and had a possible post mold present in the center. The anomaly was fairly amorphous in shape and was dark grayish brown (10YR 4/2) in color at 30 cmbgs where it was first visible. The western half was disturbed by a recent percolation test location. The anomaly continued to a depth of 40 cmbgs with FCR and charcoal present to 35 cmbgs. It appears to have been a concentration possibly located within a small basin.

Lot 7 House New
N56.6 E277

Lot 7 House New

Anomaly **N57.4 E271** was an oval shaped stain that intersected another stain to the south. At 30 cmbs, where the stain first became apparent, there was a mottled very dark grayish brown and olive brown (2.5Y3/2 and 2.5Y3/3) (Fill Deposit 1) halo around a mottled very dark grayish brown and dark gray (10YR3/2 and 10YR4/1) (Fill Deposit 2) central portion. The anomaly measured 55 by 35 cm on the surface. In profile the stain was deeper in the north half and had sloping sides but did resemble a medium size medium depth pit, possibly naturally filled (versus purposefully filled) with a filled slump/ settlement area in the center (Fill Deposit 2). No cultural material was recovered.

Lot 7 House New

Anomaly **N58.3 E268.2** appeared at the surface at 30 cmbs as a 50 cm north to south by 30 cm east to west, patch of fire-cracked rock with a darker surrounding soil. The anomaly was bisected north to south with the east half being excavated first. The first five centimeters revealed dense fire-cracked rock and charcoal, becoming less dense as excavation proceeded and surrounded by Fill Deposit 2, a dark grayish brown (2.5Y4/2) silty sand. The stain was gone by 45 cmbs and it appeared to represent a possible fire-cracked rock and hearth soil dump into a preexisting, medium sized medium depth pit. The soil within the original pit was light olive brown (2.5Y5/4). Artifacts recovered included fire-cracked rock and charcoal.

Lot 7 House New

Anomaly **N58.5 E284.9** was round-shaped half-circle measuring 65 cm long and emerging 18 cm out of the wall, that was bisected by the east wall of the house envelope. At 30 cmbgs, the anomaly was very dark gray (10YR 3/1) in color (Fill Deposit 3) and had little gravel present. Excavation revealed a medium-sized, medium-depth pit that had relatively straight sides that flared outward at the top and a base that sloped to the center. The bottom of the pit was encountered at 60 cmbgs. The pit fill contained three distinct bands of fill, likely representing three episodes of filling, each of which was higher on the edges and sloping towards the center. The uppermost fill, Fill Deposit 3, was very dark gray (10YR 3/1) in color and extended from 30 to between 35 and 45 cmbgs. This layer contained only fire-cracked rock. The middle fill layer (Fill Deposit 2) was mottled olive brown and very dark gray (2.5Y4/4 and 10YR3/1) in color while the lower fill (Fill Deposit 1) was olive brown (2.5 Y 4/4) in color. Neither the middle nor lower fills contained any artifacts. The lack of artifacts and somewhat scalloped and indistinct edges of the pit in the upper layers may indicate that a) it was created during a period of limited occupation at the site, b) there was no purposeful back filling, just natural in washing of soil, and c) a natural filling could have resulted in the irregular upper edges, as the edges of the pits collapsed into the partially filled pit, and the lower, clearer walls may have been protected from collapse due to their depth and first filling.

Lot 7 House New

Anomaly **N58.75 E278.4** was a round to oval shaped stain with a small extension to the north. This anomaly measured 70 cm north to south by 65 cm east to west and extended from 30 cmbs, where it was first encountered, to over 90 cmbs. The anomaly consisted of a very dark grayish brown (10YR3/2) halo (Fill Deposit 1) around a mottled very dark grayish brown and dark yellowish brown (10YR3/2 and 10YR4/4) central Fill Deposit 2. The overall interpretation of this anomaly is that it was a tree stump with a linear stain extending off to the west and another going down well into the C1 horizon, but it could also be a large size deep pit. One piece of coal was recovered from the first level with no other cultural material being recovered.

Anomaly **N63.6 E277.7** was a oval shaped concentration of fire-cracked rock that was bisected by the north wall of the new house envelope location. This concentration measured 70 cm long and emerged 20 cm out of the wall. Excavation revealed a shallow, 10 cm deep, deposit of FCR possibly within a small shallow basin that was very dark grayish brown (10YR3/2) in color. No reddening of the soil around the FCR was noted and the anomaly may be a FCR dump location versus a hearth. No additional artifacts were recovered other than the FCR. Post molds were identified to the south and west of this anomaly, so it may have been located within a house and possibly the nature of the soils at the site resulted or subsequent weathering of the soils resulted in a lack of oxidized/ fire reddened soils.

Anomaly **N64 E275.8** was a circular stain with a darker circle in the center, measuring 35 cm in diameter. It was first identified at the Apz to B1 interface, at 30 cmbgs where the soil color was a mottled very dark gray and pale yellow (10YR3/1 and 2.5Y8/4). The excavation revealed a historic period post mold and post hole, likely from a fence post dating to a time when the fields were used for pasture. The stain extended to 75 cmbgs, with relatively straight sides, ending in a rounded bottom. The post that would have been present measured 18 cm in diameter. The hole angles in from the top to bottom, indicating that it was dug with a shovel versus a post hole digger. Artifacts were limited to quartz debitage and charcoal in the upper levels, which are believed to have been preexisting artifacts of the prehistoric occupation accidentally incorporated into the historic post hole.

Anomaly **N68 E266.8** was a round to oval stain with some extensions to the west and southeast edges that was first visible at 30 cmbs. This anomaly was located in the center of an oval shaped house. This anomaly measured 60 cm east to west by 70 cm north to south and was bisected east to west with the north half being excavated first. The stain maintained its shape and color, very dark gray (10YR3/1) (Fill Deposit 2) for the first five centimeters, then became smaller with more diffuse edges at 10 cmbs. The stain continued to shrink towards the center as excavation proceeded, becoming an amorphous shaped pocket of mottled soil by 50 cmbs, being mottled yellowish brown and very dark gray (10YR5/6 and 10YR3/1) and disappearing by 52 cmbs. A concentration of fire-cracked rock, including one burned and incised Transitional Archaic beveled cobble abrader, and charcoal were present in the first two layers. It appears that the anomaly began as a cache pit within the house and was subsequently filled and used as the location of a hearth. Artifacts recovered included fire-cracked rock, charcoal, the beveled cobble abrader, one piece of grit-tempered pottery, and quartz shatter.
